Software v1.04 fixes:

1) Software has been revised to playback the native digital audio sent to the Cinema 11a from an outside digital source as opposed to automatically adding a certain surround format.

2) The audio output levels have been equalized across all of the surround formats so there is no jump in volume when switching from 7.1 to All Stereo and so forth.

3) Issue with subwoofer dropping out when certain Blu-ray players and Blu-ray discs are paused, rewound, or fast forwarded has been fixed.

4) Added further functionality of radio use within zone 2 in regards to the radio operation of zone 1.

5) Revised "set analog in config" menu structure. If a particular input is set to digital, either toslink or coaxial, then "not available" will be displayed for said input within the "set analog in config" as the input has been set to digital thus removing the need to alter the configuration for analog input. The ability to set analog configuration to "DSP" or "BYPASS" becomes available again once the particular input is set to "analog"

6) Revised "set analog in level" menu structure. The ability to adjust the analog input level is *only* available for analog inputs set to "DSP", so the menu structure has been revised to reflect this by displaying "not available" within the "set analog in level" for analog inputs which are set to "BYPASS".

7) Revised operation and accuracy of auto-setup. In order to perform auto setup now, the unit must be set to an open (where nothing is connected) input of 1-8. NOT HDMI 1 or 2 to perform the auto setup.

8) Revised bug where EQ settings were not properly engaging on the HDMI inputs.
